Customer Pointer Management

Pointers in MAX are a reflection of the types of credentials have been issued, and where.

Customer Pointer Management in MAX provides for manual updating of pointers only in MAX in the event a batch process failed. This functionality is used very rarely, and only by the **MVD Support Services** team.

IMPORTANT: Changing a pointer in this function only corrects the data in MAX and will NOT update the pointer with AAMVA. This function should only be used in the event a batch update failed.

1. From the Management menu, *select* **Customer Pointer Management**.
2. *Search* for the **Customer**.
3. *Use* the dropdown(s) to *select* any **pointer** updates needed.
4. *Click* **Save**.

Update Customer Pointers
